DESCRIPTION

The GRF6011 is a linear, ultra-low loss SPDT Switch that has been designed with failsafe characteristics when all voltage inputs are removed. In switching mode, the device delivers IP1dB levels greater than 1 Watt along with >49 dBm IIP3 levels for both RF paths.

When powered down (failsafe mode) RFC to RF1 defaults to a high insertion loss while RFC to RF2 defaults to a low insertion loss state that retains high linearity.

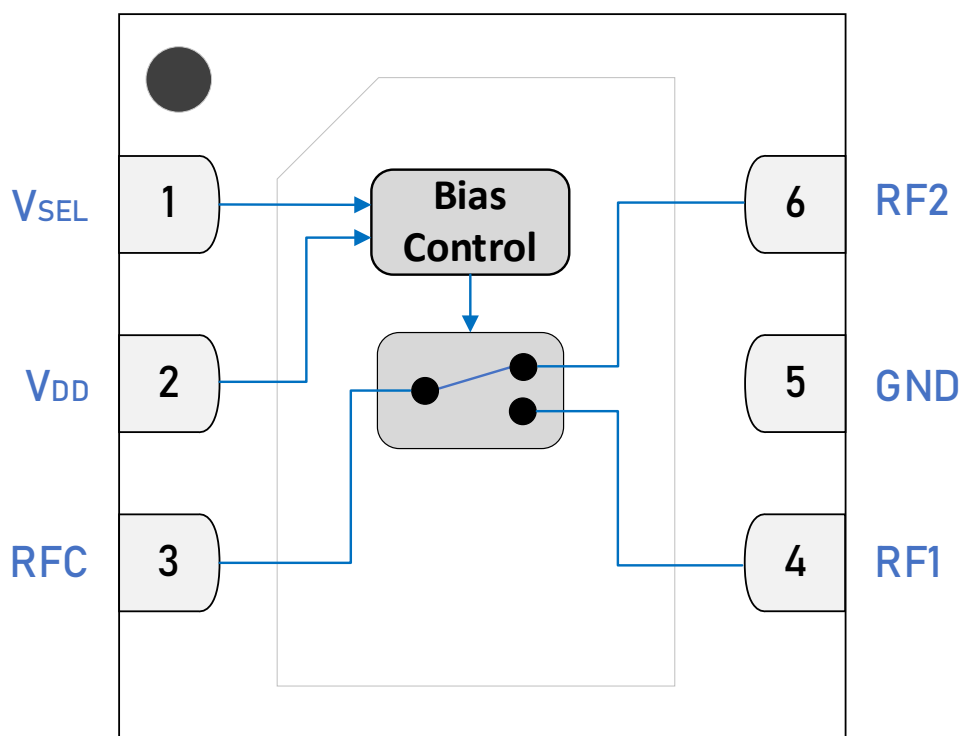

With optimization of external components, the upper frequency range of the device can be extended to 6 GHz. Data plots using this high frequency tune are also included on the following pages. Optimization for a particular band essentially involves selecting the optimal series capacitor values (M1, M4, M5) for the three RF Ports.

The device is operated from a supply voltage of 3 volts to 5 volts with the single control input (V_{SELECT}) from 3 volts up to V_{DD} .

Please consult with the GRF applications engineering team for technical support.

Pin Assignments

Pin	Name	Description	Note
1	V _{SELECT}	Switching Control Input	V _{SEL} voltage selects RF path.
2	V _{DD}	Supply Voltage Input	Supply voltage input from 3 to 5 V.
3	RFC	Common RF Path	An external DC blocking capacitor must be used.
4	RF1	RFC to RF1	This path defaults to high insertion loss when all power is removed. An external DC blocking capacitor must be used.
5	GND	Ground	No internal connection to die. We recommend connecting these pins to ground.
6	RF2	RFC to RF2	This path defaults to low insertion loss when all power is removed. An external DC blocking capacitor must be used.
PKG BASE	GND	Ground	Provides DC and RF ground as well as thermal heat sink. Recommend multiple 8 mil vias beneath the package for optimal RF and thermal performance. Refer to evaluation board top layer graphic on schematic page.

	V _{DD}	V _{SEL}	RF		RF	V _{SEL}	V _{DD}
POWER ON →	On →	On →	On	POWER OFF →	Off →	Off →	Off

NOTE: Voltage can be applied to and removed from V_{DD} and V_{SEL} simultaneously.

Data Sheet Classifications

Data Sheet Status	Notes
Advance	S-parameter and NF data based on EM simulations for the fully packaged device using foundry-supplied transistor S-parameters. Linearity estimates based on device size, bias condition and experience with related devices.
Preliminary	All data based on limited evaluation board measurements taken within the Guerrilla RF Applications Lab. All parametric values are subject to change pending the collection of additional data.
Release Ø	All data based on measurements taken with <i>production-released</i> material. TYP values are based on a combination of ATE and bench-level measurements, with MIN/MAX limits defined using <i>modelled estimates</i> that account for part-to-part variations and expected process spreads. Although unlikely, future refinements to the TYP/MIN/MAX values may be in order as multiple lots are processed through the factory.
Release A-Z	All data based on measurements taken with production-released material <i>derived from multiple lots which have been fabricated over an extended period of time</i> . MIN/MAX limits may be refined over previous releases as more statistically significant data is collected to account for process spreads.
